## A lunar library of life

SCIENTISTS have proposed storing samples of endangered creatures on the moon, in a bid to preserve the long-term biodiversity of life on Earth.

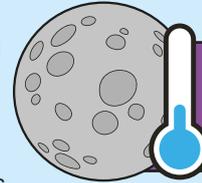

Writing in the journal *BioScience*, the researchers say that since parts of the moon's poles are in permanent shadow and very cold, it's the perfect place to store biological samples. It also means you wouldn't need a large source of power to keep them cool, and they wouldn't be in danger from war, flood or climate change.

The report says that we could, for instance, preserve corals there in case climate change kills them off, and

even store plants there for if humans

ever try to 'terraform' another planet, which means changing the environment and atmosphere to make it habitable like Earth.

The authors say that we'd need an international agreement to go ahead, but that we need to move fast because threats to habitats and animals are "accelerating faster than our ability to save these species in their natural environment."

Temperature of sheltered spots on the moon:

**-196°C**

## Videogame actors go on strike

The talented people who lend their acting and singing voices to videogames in the USA have gone on strike. The same goes for performers who lend their bodies for motion capture. They want big companies like EA and Activision to promise not to use artificial intelligence (AI) to copy their voices or their likenesses. They're worried that, if AI is used to generate characters in games, they won't be needed any more. Gaming expert George Osborn told Sky News: "Someone could try to use AI to completely generate a character based on a performer." Audrey Cooling, a spokesperson for the game companies, said that they were ready to protect performers from the use of AI.

It's not expected to delay upcoming game releases
